

Benaco: How to scan

Outlier shots
take them if you can

Regular grid
makes a for a good motion experience

Going through doors
at least one shot before the doorstep,
one on the doorstep,
one after the doorstep

More shots at side
because we can't take shots elsewhere in this room

Shots close together
because the area is very narrow

Moving diagonally
it's OK to divert from the regular grid if it does not fit into an area

DO
Regular grid
user can walk straight

DON'T
Offset grid
user can't walk straight

DO
Doorsteps
at least 3 close-by shots
user can see and walk straight through the door

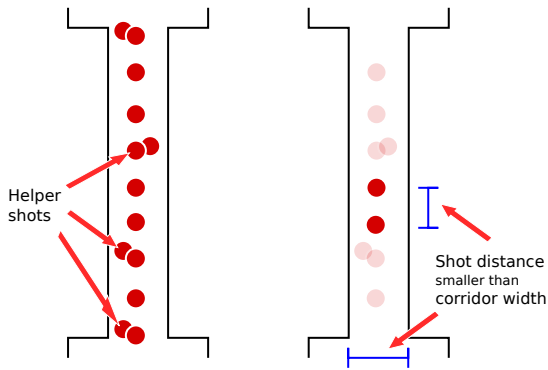

DON'T
Shots at door corners
wall occluding view into room
gives unsatisfying user experience

DO
At least 6 shots
per room
more is *always* better

DON'T
Take too few shots
the 3D model will suffer
or rooms may be missing

Benaco: Special cases

Narrow corridors

Helper shot every 3 shots and at corridor ends.

Shots closer together, smaller than corridor width.

Extra narrow corridors with doors that when opened, leave no space for the camera

Problem

Solution

Take 2 sets of photos:

1. A full set of shots through the corridor, with the doors **closed**. You can disable them after processing.
2. A full set of shots through the corridor, with the doors **opened**.

Upload all photos together.

Corners

Both corner shots can look down both corridors.

U-Turns

Like corners

Narrow staircases

Like corners + corridors
